CHEM1011 Chemistry A

Sample Exam Questions - CHEM1011

NOTES:

- 1. These sample questions were adapted from past exam papers of previous courses. Originally the questions were worth 10 marks each, however in some cases a sample question is shorter than a typical exam question because unsuitable parts of the old question have been cut out.
- 2. From 2015 onwards, the structure of the written exam questions have changed to be worth 5 marks each (ie: half as long as they are in this document). Please take this into account during your exam preparation.
- 3. This list of sample questions is NOT meant to simulate or define the size or scope of your final exam paper. It is intended merely to provide some useful study material. For details on the size and structure of your exam paper, see the specific information about the exam paper published on Moodle. In particular see and read the front page of your exam paper, that is published on Moodle.
- 4. Some answers to these sample questions, that I will publish, may include extra explanations to help you to understand the answers. Your exam answers do not need to contain more material than is required to answer the questions.
- 5. A data sheet at the end of these sample questions contains data that might be needed to answer some questions.

Steve Yannoulatos (Student Support Manager, Chemistry).

For details of the instructions on the front page of your exam paper, see the the document published on Moodle.

Write balanced ionic equations for the following chemical reactions. Include states of matter, but do not include spectator ions.

(i)	Solid barium hydroxide reacts with an excess of 0.1 M sulfuric acid to produce a precipitate of barium sulfate and water.
(ii)	A solution of copper(II) nitrate is added to a solution of sodium hydroxide to produce a precipitate of copper(II) hydroxide.
(iii)	Solid sodium oxide reacts with water to produce a basic solution.
(iv)	Solid calcium hydride reacts with water to produce a basic solution.
(v)	Sulfur dioxide gas reacts with water to produce an acidic solution.
(vi)	Solid zinc oxide reacts with sodium hydroxide solution to give a colourless solution.

- (a) Calculate the frequency of electromagnetic radiation which has a wavelength of 532 nm.
- (b) Calculate the energy of one photon of electromagnetic radiation which has a frequency of 90.0 MHz.
- (c) Use the Rydberg equation: $\frac{1}{\lambda} = R_{\text{H}} \left(\frac{1}{n_1^2} \frac{1}{n_2^2} \right)$

where $R_{\rm H} = 1.097 \times 10^7 \, {\rm m}^{-1}$ to calculate the wavelength of light required to cause a hydrogen atom to undergo a transition from the n=1 electronic state to the n=3 electronic state.

(d) (i) Write down the values of the n and l quantum numbers for these orbitals:

$$3s \qquad n = l =$$

$$4d n = l =$$

(ii) Write down all the allowed values of the quantum number m_I for the orbitals in a 3p sublevel.

$$m_l =$$

(e) In the upper atmosphere chloromethane can be decomposed by light according to the reaction:

$$CH_3Cl \rightarrow CH_3(g) + Cl(g)$$

The energy required for this reaction is 428 kJ mol^{-1} . If each molecule of chloromethane is decomposed by one photon, what is the maximum wavelength that photon can have?

(i) N

(ii) Mg	
(iii) Cr	
(iv) F ⁻	
(v) V ⁺	
b) Write down all the species from part (a) which are part (c) Write down all the species from part (a) which are isos	
d) For each of the following molecules draw a Lewis di and describe whether the molecule has a permanent of	
(i) BeCl ₂	(ii) PF ₃
Shape:	Shape:
Polar? yes / no	Polar? yes / no

(a) Using 'arrows-in-labeled-boxes' notation, write the complete ground state electronic

configurations of the following atoms and ions.

For each of the following species draw a Lewis diagram, describe the shape of the species, and describe the hybridisation at the central atom.

(i) BF ₃	(ii) SiCl ₄
Shape:	Shape:
Hybridisation:	Hybridisation:
(iii) CO ₂	(iv) H ₃ O ⁺
Shape:	Shape:
Hybridisation:	Hybridisation:
(v) XeF ₂	
Shape:	
Shape.	
Hybridisation:	

(a) (i) Draw all resonance structures for NO_3^- , each obeying the octet rule.

- (ii) Write down the hybridization of the nitrogen atom in NO_3^- .
- (iii) What type of orbitals on the nitrogen atom and oxygen atoms in NO_3^- overlap to produce the π bond in this ion?
- (iv) Would you expect the N–O bond in NO_3^- to be longer or shorter than the N–O bond in hydroxylamine, H_2N –O–H?
- (b) The table below shows the normal boiling points of the group 17 hydrides.

Compound	HF	HC1	HBr	HI
Normal boiling point / °C	20	-85	-67	-35

- (i) What is the dominant type of intermolecular force which determines the normal boiling points of the compounds HCl, HBr, and HI?
- (ii) What is the dominant type of intermolecular force which determines the normal boiling point of HF?
- (c) Calculate the pressure of 100.0 mol of xenon in a 15.0 L vessel at 300 K using the van der Waals equation: $(P + a(\frac{n}{V})^2)(V nb) = nRT$ where, for xenon, a = 4.19 atm L² mol⁻² and b = 0.0511 L mol⁻¹

In the week laboratory experiment "Volumetric Analysis" the concentration of a sodium hydroxide solution was determined by titration with a standard potassium hydrogenphthalate (KHP) solution.

(a) Calculate the concentration of KHP standard solution obtained by dissolving 5.10 g of KHP (molar mass 204.22 g mol⁻¹) into 250.0 mL of water, in a volumetric flask.

(b) Four 25.00 mL samples of the KHP standard solution were each titrated with the unknown sodium hydroxide solution. The results are given in the table below.

Titration	Initial Reading (±0.05 mL)	Final Reading (±0.05 mL)	Titre (±0.1 mL)	Used in calculation? (Yes/No)
1	0.05	35.55		
2	0.40	35.50		
3	0.45	35.55		
4	1.60	36.70		

- (i) Complete the 'Titre' data in the table.
- (ii) Make use of data in the table to calculate the concentration of the sodium hydroxide solution, assuming that KHP is a monoprotic acid.

(iii) Complete the 'Used in calculation?' data in the table, to indicate which titres were used in the calculation of the sodium hydroxide solution. Comment briefly on how you decided which titres to use in the calculation.

Q UI	ESTI	ON 7				
(a)		40 mL cylinder contained xenon gas at 123 kPa and 20.0 mL of liquid 2-butanone at 25 °C. a: the vapour pressure of 2-butanone is 13.3 kPa at 25 °C.)				
	(i)	The volume of the container is increased to $1.00\mathrm{L}$ keeping the temperature constant. What is the total pressure in the container?				
	(ii)	100 mL of argon gas (measured at 101 kPa and 25 $^{\circ}$ C) is then added to the 1.00 L container. What is the total pressure in the container, assuming the volume of liquid is still 20.0 mL?				
(b)	At 25 °C the vapour pressure of pure benzene (C_6H_6 , molar mass = 78.1 g mol ⁻¹) is 95.1 Torr and that of pure toluene ($C_6H_5CH_3$, molar mass = 93.1 g mol ⁻¹) is 28.4 Torr.					
	(i)	Calculate the total vapour pressure of a solution containing $40.0~\rm g$ of benzene and $20.0~\rm g$ of toluene at $25~\rm ^{\circ}C$, assuming ideal behaviour of the solution.				
	(ii)	Calculate the partial pressure of benzene in the gas phase above the mixture.				

(iii) A sample of the vapour in equilibrium with the mixture was isolated and cooled until the vapour completely condensed into liquid. Calculate the mole fraction of benzene in this

liquid.

(a) Complete the following table, writing "none" where appropriate:

Conjugate Acid	Species	Conjugate Base
	NH ₃	
	CH ₃ CH ₂ COOH	
	HCO3	

(b) Supply the missing information in the table below:

	[H ⁺] (mol L ⁻¹)	рН	[OH ⁻] (mol L ⁻¹)	рОН
(i)	3.4 x 10 ⁻⁴			
(ii)		8.2		

(c) Write down the oxidation number of the element indicated in the species shown above it.

Species:	Cu ₂ O	so ₃ ²⁻	P ₄	S ₂ O ₃ ²⁻
Element:	Cu	S	P	S
Oxidation number:				

(a) Write equilibrium expression in terms of K_p for each of the following:

$$\text{(i)} \qquad 2 \text{ HgO(s)} \implies 2 \text{ Hg}(\ell) + \text{O}_2(g)$$

(ii)
$$2 \text{ NO(g)} \implies \text{N}_2(g) + \text{O}_2(g)$$

(b) The equilibrium constant K_p for 2 NO(g) + O₂(g) \rightleftharpoons 2 NO₂(g) at 298K is 1.6×10^{12} (standard state = 1 bar). Calculate the K_p for NO₂(g) \rightleftharpoons NO(g) + $\frac{1}{2}$ O₂(g) at the same temperature.

(c) Calculate whether a net reaction will occur and, if so, in which direction, for the following initial conditions: a 1.0 L flask containing the gases NO, O_2 and NO_2 , each with a partial pressure of 0.010 bar at 298 K.

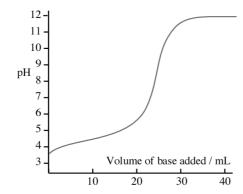

(a)	7	The pK _a for hydrazoic acid (HN ₃) is 4.65. What is the pH of a 0.20 M HN ₃ solution?
(b)		The p K_a for acetic acid (CH ₃ COOH) is 4.76. Calculate the pH of a solution that is 0.130 nolar in acetic acid.
	(ii)	100.0 mL of 0.130 molar acetic acid is mixed with 60.0 mL of 0.100 molar sodium hydroxide. Calculate the pH of the resulting solution.
	(iii)	$1.0~\rm mL$ of $0.10~\rm mol~L^{-1}~HCl(aq)$ is added to the solution from part (ii). Calculate the change in pH of the solution caused by the addition of the hydrochloric acid.

(a) The p K_a for acetic acid (CH₃COOH) is 4.76. Calculate the pH of a solution that is 0.130 molar in acetic acid and 0.240 molar in sodium acetate.

(b) Briefly describe TWO methods that could be employed to prepare the buffer in part (a) in the laboratory.

- (c) The following questions refer to the titration curve shown at the bottom of this page.
 - (i) From the curve estimate the pH at the equivalence point.
 - (ii) Estimate the pK_a of the substance being titrated.
 - (iii) What class of titration does this curve typify? Circle your answer from the list below.

 strong acid/strong base strong acid/weak base weak acid/strong base
 - (iv) Given the pK_a values for several indicators in the table on the right below, choose the BEST indicator for this titration. Justify your answer.

	pK_a at 25 °C
methyl orange	3.7
methyl red	5.1
bromothymol blue	7.0
phenolphthalein	9.6

(a)	Write the formula for a salt which gives an acidic solution in water, and write an ionic equation to show the acidic behaviour. salt is ionic equation:
(b)	Write the formula for a salt which gives a basic solution in water, and write an ionic equation to show the basic behaviour. salt is
(c)	Write the formula of a salt which gives a neutral solution in water. salt is
(d)	Write the formula for a Lewis acid, and write an equation to show the Lewis acidic behaviour. Lewis acidequation:
(e)	Write the formula for an oxide which gives an acidic solution in water, and write an ionic equation to show the acidic behaviour. oxide is
(f)	Write the formula for an oxide which gives a basic solution in water, and write an ionic equation to show the basic behaviour. oxide is

From	the following list of compounds; NH_4Br NaI SO_3 KBr CaO CsF $B(OH)_3$ CO
(a)	Choose the formula for a salt that gives an acidic solution in water, and write an ionic equation to show the acidic behaviour. The salt isionic equation:
(b)	Choose the formula for a salt that gives a basic solution in water, and write an ionic equation to show the basic behaviour. The salt is
(c)	Choose the formula of a salt that gives a neutral solution in water. The salt is
(d)	Choose the formula for a Lewis acid, and write an equation to show the reaction of the Lewis acid with water. The Lewis acid isequation:
(e)	Choose the formula for an oxide that gives an acidic solution in water, and write an ionic equation to show the acidic behaviour. The oxide is
(f)	Write the formula for an oxide that gives a basic solution in water, and write an ionic equation to show the basic behaviour. The oxide is

- (a) When 2.50 g of ammonium chloride is dissolved in 100.0 g of water the temperature falls by 1.70 K. Calculate the enthalpy of solution of ammonium chloride, assuming a specific heat capacity of 4.2 J K⁻¹ g⁻¹ and a density of 1.00 g mL⁻¹ for all solutions.
- (b) Write suitable chemical equations including the states of matter for all reactants and products, to represent each of the following processes:
 - (i) the standard enthalpy of formation of solid calcium fluoride.
 - (ii) the molar enthalpy of sublimation of caesium.
 - (iii) the standard enthalpy of condensation of bromine.
 - (iv) the first ionization enthalpy of magnesium.
 - (v) the first electron affinity of oxygen.
- (c) A calorimeter was used to measure the heat of reaction for mixing 100 mL of 0.100 M Ag $^+$ (aq) with 100 mL of 0.100 M Cl $^-$ (aq). The observed temperature change was +0.770 K for the 200 ml of solution (specific heat = 4.35 J K $^{-1}$ g $^{-1}$; density of solution = 1.00 g mL $^{-1}$) and calorimeter. The heat capacity of a calorimeter was 7.31 J K $^{-1}$.
 - (i) Write the ionic equation for the reaction.
 - (ii) How much heat was absorbed by the calorimeter?
 - (iii) How much heat was absorbed by the solution?

(a) State Hess's Law.

(b) (i)
$$2 \text{ CIF}(g) + O_2(g) \rightarrow \text{ Cl}_2O(g) + OF_2(g)$$
 $\Delta H^{\circ} = 167.5 \text{ kJ}$

(ii)
$$2 F_2(g) + O_2(g) \rightarrow 2 OF_2(g)$$
 $\Delta H^{\circ} = -43.5 \text{ kJ}$

(iii)
$$2 \text{ ClF}_3(l) + 2 \text{ O}_2(g) \rightarrow \text{ Cl}_2\text{O}(g) + 3 \text{ OF}_2(g)$$
 $\Delta \text{H}^{\circ} = 394.1 \text{ kJ}$

Using appropriate data from the thermochemical equations above, calculate the standard enthalpy change for the following reaction:

$$ClF(g) + F_2(g) \rightarrow ClF_3(l)$$

$$4 \text{ HCl}(g) + O_2(g) \stackrel{\text{Col}}{=} 2 \text{ H}_2O(g) + 2 \text{ Cl}_2(g)$$
 $\Delta H^{\circ} = -114 \text{ kJ mol}^{-1}$

A mixture of HCl, O_2 , H_2O , and Cl_2 is brought to equilibrium in a container at 400 °C. By placing a *tick* in the appropriate box indicate the effect on the equilibrium amount of $Cl_2(g)$ in the container.

	Increase	Decrease	No Change
O ₂ is added at constant volume.			
HCl is removed at constant volume.			
Volume of the reaction container is doubled.			
A catalyst is added.			
Temperature is increased to 500 °C.			

(a) Urea $(OC(NH_2)_2)$ can react with water to produce carbon dioxide and ammonia:

$$\mathrm{OC}(\mathrm{NH}_2)_2(s) \ + \mathrm{H}_2\mathrm{O}(l) \rightarrow 2\mathrm{NH}_3(g) + \mathrm{CO}_2(g)$$

(i) Calculate ΔH° for the above reaction at 25 °C.

Thermodynamic data (at 25 °C, standard state = 1 bar)				
	$\Delta H_{\mathrm{f}}^{\circ}$ / kJ mol $^-$	S° / J K ⁻¹ mol ⁻¹		
	1			
NH ₃ (g)	-46	193		
$CO_2(g)$	-394	214		
$OC(NH_2)_2(s)$	-334	105		
H ₂ O(l)	-286	70		

(ii) Calculate ΔS° for the above reaction at 25 °C.

- (iii) Calculate ΔG° for the above reaction at 25 °C.
- (iv) Based on your answer to (iii), state whether the reaction above is spontaneous or not spontaneous under standard state conditions at 298 K. Justify your answer.

(a) Complete the following table, by writing "increase", "decrease" or "no change" to indicate the effect each of the listed changes will have when applied to the mixture of gases in the following equilibrium reaction:

$$2 \text{ NO}(g) + O_2(g) \implies 2 \text{ NO}_2(g) + \text{heat}$$

Change	Effect on amount of NO ₂ at equilibrium	Effect on Kp
Removing some NO from container		•
Adding a catalyst		
Adding O ₂ to container		
Increasing temperature		
Compressing the container to a smaller volume (at constant temperature)		

(b) Consider the electrochemical cell represented by the following cell diagram:

$$Zn(s) | Zn^{2+}(aq) || Ag^{+}(aq) | Ag(s)$$

- (i) Write a balanced half-equation for the reaction occurring at the anode.
- (ii) Write a balanced half-equation for the reaction occurring at the cathode.
- (iii) Write a balanced equation for the overall reaction occurring in this cell.
- (iv) Using data from the adjacent table calculate the standard emf for this cell.

Standard reduction potentials, E°/V		
(at 25 °C, standard state = 1 mol L^{-1})		
$Zn^{2+} \mid Zn$	-0.76	
$Ag^+ Ag$	0.80	

- (v) Use the cell emf to calculate ΔG° for the cell reaction.
- (b) Calculate the current required (in amps) to deposit 0.500 g of chromium metal from a solution containing $Cr^{3+}(aq)$ in a period of 1.00 hour.

CHEM1011

DATA SHEET

 $0 \, ^{\circ}\text{C} = 273 \, \text{K}$

1 atm = 1.031 bar = 760 mmHg = 101.3 kPa = 760 Torr

Gas Constant $R = 8.314 \text{ J mol}^{-1} \text{ K}^{-1} = 0.08206 \text{ L atm mol}^{-1} \text{ K}^{-1}$

Avogadro Number $N_A = 6.022 \times 10^{23} \text{ mol}^{-1}$

Speed of Light $c = 2.99 \times 10^8 \text{ m s}^{-1}$

Planck Constant $h = 6.626 \times 10^{-34} \,\mathrm{J s}$

Planck equation : $E = hv = hc/\lambda$

Faraday Constant $F = 96,500 \text{ C mol}^{-1}$

Nernst Equation $E_{cell} = E^{\circ}_{cell} - \frac{RT}{nF} \ln Q$

Faraday Equation $Q = i \times t = \text{amount electrons (mole)} \times F$

Heat capacity of water, $C_p = 75 \text{ J K}^{-1} \text{ mol}^{-1}$

Enthalpy of fusion of water, $\Delta H_m = 6 \text{ kJ mol}^{-1}$
